1. At what point does the line 2x - y = 3 intersect the line x + 2y = -1?

Solution. The point of intersection may be obtained by solving the two equations simultaneously. For this multiply the first equation by 2 and add that to the second equation obtaining the equation

$$5x = 5$$
.

Thus, x = 1, and, using either of the two original equations, one finds y = -1. The required point is (1, -1).

2. Find all solutions of the quadratic equation $x^2 - x - 12 = 0$.

Solution. The well known formula for solution of the quadratic equation $ax^2 + bx + c = 0$ is

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \ .$$

In this case one finds

$$x = \frac{1 \pm \sqrt{1 - 4(1)(-12)}}{2} = \frac{1 \pm 7}{2} = 4 \text{ or } -3.$$
